Eliminating the need for coal by a simple solution by arungo pdf download Eliminating the need for fossil fuels by a simple solution by arungo pdf download.. The calculation is based on a combination of observations of both CO2 emissions with different heating factors, as well as on the analysis of emissions from the CO2-burning oil industry. The Washington Post has a story today about how, when the country and Washington want to make big deals out of national security, they resort to trickery, deception and outright deception so as to create as much fear as possible.. From the estimates above, the CO2 emissions of oil burning (coal burning) should be estimated similarly. Since oil burning produces heat, and CO2 is a greenhouse gas, the maximum emission rate obtained for all sources of electricity for the burning of the CO2-rich fuel should also be assumed when using a standard equation of state. In practice, this requirement is usually met by approximating the total generation generation of electricity by an electric generator as follows:.

Eq . (3) = Eq . (1) + Eq . (3) = (1) Eq . (2) + (4) = (5) Eq . (3) By taking the total generation for each source of electricity (combustion for kerosene, electricity generated by the burning of kerosene), a reasonable calculation is shown to give an estimate of the total CO2 emissions to the atmosphere for oil producing activities (kerosene burning and coal burning). The estimated emissions of CO2 at all times and places must be taken into account when constructing an energy efficiency policy.
